                                                                                                                                                                                                        NOTE: This is a 'working draft' sequence. It currently consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

1 134419: contig of 134419 bp in length.

Beta-2 adrenalin subtype; cyanopindrol; agonist; a asthmatic disease; ss.
                                                                              21-DEC-1998 (first entry)
Human beta-2-adrenergic receptor
Beta-2-adrenergic receptor; human
                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel beta-2 adrenalin receptor sub-type - useful for screening for agonists and antagonists and researching asthmatic diseases Disclosure; Page 27-30; 47pp; Japanese.

This sequence encodes the protein of the invention. The protein of the invention is a beta-2 adrenalin receptor subtype with Kd value of approximately 75 pM against 1251-cyanopindrol. The protein can be used screening for agonists and antagonists, which are useful in researching asthmatic diseases.

problem beta? adrenergic receptor proteins.

Conceptor protein of beta? adrenergic receptor gene, and (b) accord alleles of the beta? adrenergic receptor gene, and (b) accord alleles both encode Arg at residue 16 of the beta? adrenergic receptor gene, and (b) accord alleles both encode Arg at residue 16 of the beta? adrenergic receptor gene alleles may be creceptor protein. Beta? adrenergic receptor gene alleles may be creceptor protein. Beta? adrenergic receptor gene alleles may be creceptor protein. Beta? adrenergic receptor gene alleles may be creceptor gene alleles which creceptor gene alleles may be creceptor gene as being linked creceptor gene as general gen

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 망
                                                              The probe was a 600 bp fragment of the coding region of the human beta-3 constructed from golya-transmentrative for coding region from adipose tissue cells. The sequence was isolated from a cDNA library receptor (RA-Ca-b2) gene. The sequence was isolated from a cDNA library receptor (RA-Ca-b2) gene. The sequence was isolated from a cDNA library receptor (RA-Ca-b2) gene. The sequence was isolated from a cDNA library receptor constructed from polya-RA-Na purified from dop brown adipose tissue cells. Cc constructed from polya-Rayment of the coding region of the human beta-3 croptobe was a 600 bp fragment of the coding region of the human beta-3 cc transmembrane domain 5 (TM5). The full length insert was cloned into M13 cc transmembrane domain 5 (TM5). The full length insert was cloned into M13 cc expressed e.g. in a mammalian cell, by subcloning into an expression expressed e.g. in a mammalian cell, by subcloning into an expression studies, e.g. for differential screening of ligands cc specific for RA-Ca-b2 or RA-Ca-b3 (W44933).

                                                                                                                                                                                                                                                                                                                                                                                                                                 PT Wild type and mutated sequences of Mycobacterium embCAB operon - PT useful to e.g. identify ethambutol-resistant mycobacterial strains PT and produce antisense sequences to treat mycobacterial infections PS Disclosure; Fig 6A-I; 62pp; English.

CC This is the DNA sequence of the Mycobacterium smegmatis embCAB coperon, which determines resistance to the antimycobacterial drug CC ethambutol (EMB). It includes the embA, embC and embb genes that CC encode proteins (see W73052-54) which are the target of action of CC magmatis for EMB. To identify genes conferring EMB resistance, CC a genomic library from a high level EMB-resistant mutant of M.

CC smegmatis was introduced into wild-type M. smegmatis mc2155. Four CC overlapping cosmids were identified which conferred a resistant CC phenotype. The minimum size fragment capable of conferring EMB CC smegmatis sequence was dequences reverlang 3 homologous open CC resistance was dequences reverlang 3 homologous open CC mycobacteria or to determine the susceptibility of mycobacteria to CC mycobacteria or to determine the susceptibility of mycobacteria to CC EMB. The nucleic acids are also useful in the treatment of mycobacteria infections; anti-DNA or anti-RNA sequences can be CC administered to inhibit embCAB operon mRNA activity (claimed). The CC invention additionally provides for the use of embCAM operon CC cucleic acid sequences as vaccines, or to improve existing

The human cardiacyDrain tolloid-like protein (hC/BTLP) inadequate or excessive activity is associated with restenosis, atherosclerosis, congestive heart failure, chronic obstructive pulmonary disease, benign prostatic hypertrophy, glomerulonephritis, nephritis, fibrosis, gliosis, cirrhosis and anomalous wound healing (e.g. keloids). Disease or susceptibility to disease related to expression or activity of hC/BTLP can be diagnosed by detecting a mutation in the gene encoding hC/BTLP. Polypeptides and polynucleotides of hC/BTLP can be diseases.

Example 1; Page 57-62; 105pp; English.

A previously described large open reading frame (T45828) for A previously described large open reading frame (T45828) for hepatitis GB virus (HGBV) isolate C genotype 1 is provided. The availability of HGBV nucleic acid sequences (see also T45836) obtd.

e.g. by PCR amplification, permits the construction of expression vectors encoding antigenically active regions of the HGBV protein (see also W06536). Novel recombinant HGBV polypeptides are useful as immunoassay reagents for HGBV antigens or antibodies. They can also be used in vaccine prodn., to determine clearance of HGBV from an infected patient and to raise antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                            23-FEB-1998 (first entry)
23-FEB-1998 (first entry)
Fragment of HGBV NS3 genomic region.
Frimer; hepatitis GB virus; HGBV; serotype; hybridisation; RT-PCR; LCR; reverse transcriptase; probe; amplification; gap ligase chain reaction; blood; organ; detection; diagnosis; ss.
        Oligo.nucleotide(s) specific for hepatitis GB virus-C, useful as probes and primers - for diagnosis, screening blood etc. and design of specific poly; peptide(s)

Example 1; Page 51-56; 96pp; English.

The invention relates to nucleic acid sequences derived from a novel Hepatitis GB virus (HGBV), a form of non-A to-non-E hepatitis, especially the C serotype of the virus. This sequence represents the NS3 region of the virus genome. The probe (corresponding to bases 4245-4432) can be used to detect, by hybridisation, the presence of HGBV-C serotype nucleic acids in a sample following by RT-PCR amplification of the viral genome.
                                                                                                                                                                                Erker JC, Leary TP, Muerhoff AS, WPI; 97-179430/16.

For the E2 antigen (see W63611) of hepatitis GB virus isolate C (HGBV-C). The invention relates to E2 antigenic epitopes (see W63612-16) and methods for detection of HGBV are utilised to E3 samples. Antibodies to the E2 region of HGBV are utilised to capture antigen capture to the E2 region of HGBV are utilised to the propagation, identification, detection and products can be used for and antigen capture PCR. The methods and products can be used for the propagation, identification, detection and isolation of HGBV.

They will also allow the preparation of diagnostics and vaccines for the possible different strains of HGBV, and will have utility
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

CC The present sequence is of a human tolloid-like (mTll) cDNA. This CC sequence was derived from clones isolated from a human placenta genomic CC library. The human Tll gene maps to the 4925-4qter region on chromosome CC 4. As the human Tll gene maps to the 4925-dqter region on chromosome CC protein (mTl), it is expected to be a protease having a key role in CC development and homeostatic processes such as wound healing. The CC invention claims that human Tll protein can be used for promoting CC maturation of extracellular matrix precursors into macromolecular CC structures, for activating growth factors in vivo and in vitro and for accelerating developmental and homeostatic processes when administered CC to a tissue. Human Tll protein may also be used to develop inhibitors CC against lite enzymatic activity. Such inhibitors would be useful in CC preventing fibrosis and excess scarring or other abnormalities of wound CC healing. Specific antibodies raised against the C-terminal region of CC human Tll (W40226) can be used in assays for visualising the production and localisation of mTll protein in cells and tissues.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ş
                                                                                                                                                                                      That encoding BssHII restriction and methylase enzymes - useful for molecular cloning and recombinant production of the enzymes Example 1; Fig 1A-B; Spp; English.

C This cDNA encodes a Bacillus stearothermophilus BssHII multi-specific methylase enzyme. The specification provides sequences of BssHII centonic endonuclease gene (bssHIIM) and bssHIII restriction endonuclease gene (bssHIIM). A recombinant vector containing these genes are used to transform host cells to recombinantly produce the BssHII restriction enzyme (BssHIIR), and its cognate methylase enzyme (BssHIIM), for use in genetic engineering. The enzymes recognise the sequence 5'GCGCGC3', and the methylase also recognises the sequences 5'RCGCGC3', and the methylase also recognises the sequences 5'RCGCGC3', and the methylase also recognises the sequences 5'RCGCGC3', and the methylase also recognises the sequences 1608 BP; 390 A; 440 C; 489 G; 289 T;

PS Claim 1; Page 988; 2245pp; Japanese.
Cd obble-stranded DNA (or its complementary strand or the corresp.
Cd obble-stranded DNA) which comprises one of the 7837 "GS" sequences
Cd 91ven in T19001-T26837 and which is able to hybridise to part of
Cd 91ven in T19001-T26837 and which is claimed. The GS (Gene Signature)
CC human genomic DNA, CDNA or mRNA is claimed. The GS (Gene Signature)
CC sequences were obtained from 3'-directed cDNA libraries prepared
CC grom various human tissues; synthesis of cDNA was initiated from the
CC untranslated sequence is unique to a particular mRNA species, almost
CC untranslated sequence is unique to a particular mRNA species, almost
CC all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC is constructed so as to reflect accurately the relative abundance of
CC different mRNAs in the particular tissue from which it was derived.
CC determined (esp. using primers and probes derived from the GS
CC determined (esp. using primers and probes derived from the GS
CC sequences) as a means of diagnosing abnormal cell function or for
CC crecognising different cell types.
CC Sequences 323 BP; 111 A; 47 C; 63 G; 95 T;

This sequence encodes an amino acid sequence which is responsible for one of the steps in microsporogenesis, which is responsible for one of the steps in microsporogenesis, specifically tassel development. This cDNA was isolated from a specifically tassel development. This cDNA is considered this tassel derived cDNA and was named MS45. The introduction of this tassel derived cDNA into a plant, pref. maize, which is normally male sterile causes it to be fertile. Such transformed plants may be used as female parents in the production of hybrid seeds. Sequence 1419 BP; 304 A; 387 C; 473 G; 255 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        nucleic search, using sw model

```
Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
C18250 377 bp mRNA EST UZ-UCI-1390 C18250 Human placenta cDNA (TFUjiwara) Homo sapiens cDNA clone GEN-559E06 5', mRNA sequence.
